Basic Operations with Lists

CLARUSWAY©
WAY TO REINVENT YOURSELF

Basic Operations with `lists`

- Creating an empty list is a phenomenon in Python.

How to create an empty list?

Basic Operations with `lists`

- Two methods for creating an empty list.

```
empty_list_1 = []
empty_list_2 = list()
```

Basic Operations with `lists`

- `.append()` appends an object to the end of a `list`.

- `.append()`
- `.insert()`

Basic Operations with `lists`

- `.append()` appends an object to the end of a `list`.

- `.append()`
- `.insert()`

```
numbers = [1, 4, 7]
numbers.append(9)
numbers.append('9')
print(numbers)
```

What is the output? Try to figure out in your mind...

Basic Operations with `lists`

- We can add an element into a list using `.append()` or `.insert()` methods.
- `.append()` appends an object to the end of a `list`.

- `.append()`
- `.insert()`

```
numbers = [1, 4, 7]
numbers.append(9)
numbers.append('9')
print(numbers)
```

```
[1, 4, 7, 9, '9']
```

Basic Operations with `lists`

- Take a look at the example 👇

```
1  empty_list = []
2  empty_list.append(6666)
3  empty_list.append('Multiverse')
4  empty_list.append([0])
5
6  print(empty_list)
7
8
```

What is the output? Try to figure out in your mind...

Students, write your response!

Pear Deck Interactive Slide
Do not remove this bar

Basic Operations with `lists`

- Take a look at the example 👇

```
1  empty_list = []
2  empty_list.append(6666)
3  empty_list.append('Multiverse')
4  empty_list.append([0])
5
6  print(empty_list)
7
8
```

Output

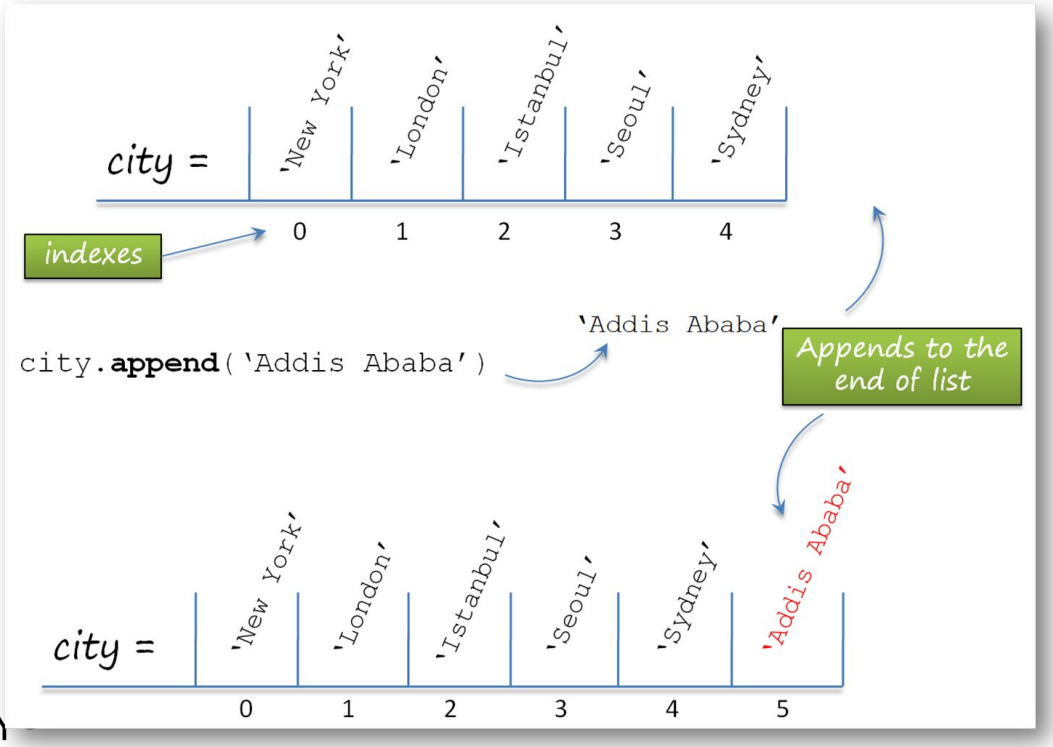
```
[6666, 'Multiverse', [0]]
```

Basic Operations with `lists`

- Here's the pre-class example 👇

```
1  city = ['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']
2  city.append('Addis Ababa')
3
4  print(city)
5
```

Basic Operations with `lists`



Basic Operations with `lists`

- Here's an another example 👇

```
1  city = ['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']
2  city.append('Addis Ababa')
3
4  print(city)
5
```

```
1  ['New York', 'London', 'Istanbul', 'Seoul', 'Sydney', 'Addis Ababa']
2
```

Basic Operations with `lists`

- Task :
  - Create an empty `list` and then collect the `int` numbers (1 - 4) one by one into the `list` you created using `.append()` method.

Basic Operations with `lists`

- The code can be like :

```
numbers = []
numbers.append(1)
numbers.append(2)
numbers.append(3)
numbers.append(4)

print(numbers)
```

```
[1, 2, 3, 4]
```

Basic Operations with `lists`

- `.insert()` adds a new object to the `list` at a specific (given) **index**.

- `.append()`
- `.insert()`

Basic Operations with `lists`

- `.insert()` adds a new object to the `list` at a specific (given) index.

- `.append()`
- `.insert()`

```
numbers = [1, 4, 7]
numbers.insert(2, 9)
print(numbers)
numbers.insert(2, 6)
print(numbers)
```

What is the output? Try to figure out in your mind...

Basic Operations with `lists`

- `.insert()` adds a new object to the `list` at a specific (given) index.

- `.append()`
- `.insert()`

```
numbers = [1, 4, 7]
numbers.insert(2, 9)
print(numbers)
numbers.insert(2, 6)
print(numbers)
```

Adds into index '2'

```
[1, 4, 9, 7]
[1, 4, 6, 9, 7]
```

```
|  |  |  |  |
0  1  2  3  4
```

Basic Operations with `lists`

- Consider this pre-class example 👇

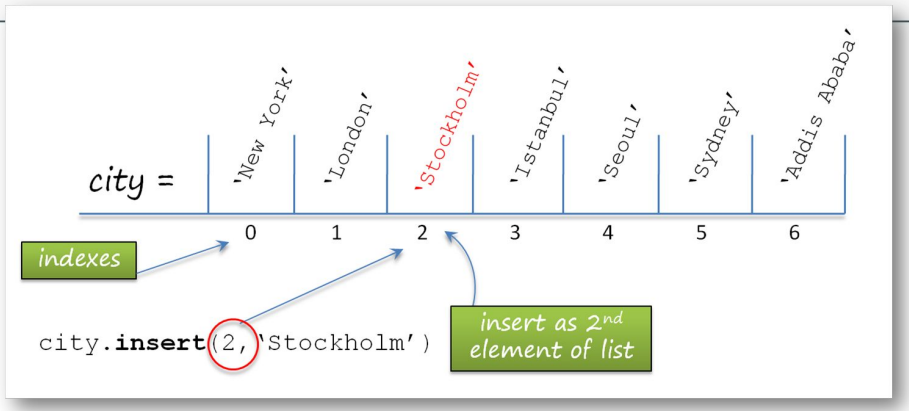
```
1  city = ['New York', 'London', 'Istanbul', 'Seoul', 'Sydney', 'Addis Ababa']
2  city.insert(2, 'Stockholm')
3
4  print(city)
5
```

Basic Operations with `lists`

- Consider this pre-class example 👇

```
1  city = ['New York', 'London', 'Istanbul', 'Seoul', 'Sydney', 'Addis Ababa']
2  city.insert(2, 'Stockholm')
3
4  print(city)
5
```

```
1  ['New York', 'London', 'Stockholm', 'Istanbul', 'Seoul', 'Sydney', 'Addis Ababa']
2
```

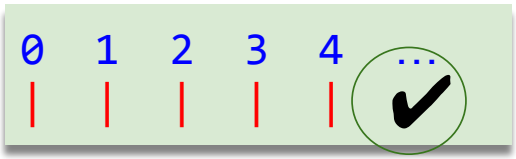


Basic Operations with `lists`

- Task :
  - Create a `list` which consists of the `int` numbers (1, 2, 3, 4) and then insert number **5** at the **end** of the `list` using `.insert()` method.

Basic Operations with `lists`

- The code can be like :



```
numbers = [1, 2, 3, 4]
numbers.insert(4, 5)

print(numbers)
```

```
[1, 2, 3, 4, 5]
```

Basic Operations with `lists`

- `.remove()` removes the elements from the `list`.

- `.remove()`
- `.sort()`

Basic Operations with `lists`

- We can remove and sort the elements of the `list`.
- `.remove()` removes the elements from the `list`.

- `.remove()`
- `.sort()`

```
numbers = [1, 4, 7, 9]
numbers.remove(7)
print(numbers)
```

Basic Operations with `lists`

- We can remove and sort the elements of the `list`.
- `.remove()` removes the elements from the `list`.

- `.remove()`
- `.sort()`

```
numbers = [1, 4, 7, 9]
numbers.remove(7)
print(numbers)
```

```
[1, 4, 9]
```

Basic Operations with `lists`

- Consider this pre-class example 👇

```
1  city = ['New York', 'London', 'Stockholm', 'Istanbul', 'Seoul', 'Sydney', 'Addis Ababa']
2  city.remove('London')
3  print(city)  # we have deleted 'London'
4
```

Basic Operations with `lists`

- Consider this pre-class example 👇

```
city = ['New York', 'London', 'Stockholm', 'Istanbul', 'Seoul', 'Sydney', 'Addis Ababa']
city.remove('London')
print(city)  # we have deleted 'London'

```

```
['New York', 'Stockholm', 'Istanbul', 'Seoul', 'Sydney', 'Addis Ababa']

```

Basic Operations with `lists`

- `.sort()` sorts the elements in the `list`.

- `.remove()`
- `.sort()`

Basic Operations with `lists`

- `.sort()` sorts the elements in the `list`.

- `.remove()`
- `.sort()`

```
numbers = [4, 1, 9, 7]
numbers.sort()
print(numbers)
```

Students, write your response!

Basic Operations with `lists`

- `.sort()` sorts the elements in the `list`.

- `.remove()`
- `.sort()`

```
numbers = [4, 1, 9, 7]
numbers.sort()
print(numbers)
```

```
[1, 4, 7, 9]
```

Basic Operations with `lists`

- Here's the pre-class example 👇

```
city = ['New York', 'Stockholm', 'Istanbul', 'Seoul', 'Sydney', 'Addis Ababa']
city.sort()  # lists the items in alphabetical order
print(city)

```

Basic Operations with `lists`

- Here's an example 👇

```
city = ['New York', 'Stockholm', 'Istanbul', 'Seoul', 'Sydney', 'Addis Ababa']
city.sort()  # lists the items in alphabetical order
print(city)

```

```
['Addis Ababa', 'Istanbul', 'New York', 'Seoul', 'Stockholm', 'Sydney']

```

Basic Operations with `lists`

- `.sort()` sorts the elements in the `list`.

```
mix_list = ['d', 1, 'a', 7]
mix_list.sort()
print(mix_list)
```

What is the output? Try to figure out in your mind...

Students, write your response!

Pear Deck Interactive Slide
Do not remove this bar

Basic Operations with `lists`

- `.sort()` sorts the elements in the `list`.

```
mix_list = ['d', 1, 'a', 7]
mix_list.sort()
print(mix_list)
```

```
TypeError                                 Traceback (most recent call
last)
<ipython-input-7-ad44188425eb> in <module>
      1 mix_list = ['d', 1, 'a', 7]
----> 2 mix_list.sort()
      3 print(mix_list)

TypeError: '<' not supported between instances of 'int' and 'str'
```

Basic Operations with `lists`

- `.sort()` sorts the elements in the `list`.

```
mix_li
mix_li
print(
```

The items to be sorted in the list should be the same type.

```
TypeErro                                                    recent call
last)
<ipythor
      1 mix_list = [ a , 1,  a , 7]
----> 2 mix_list.sort()
      3 print(mix_list)

TypeError: '<' not supported between instances of 'int' and 'str'
```

Basic Operations with `lists`

- Sort these elements in the `lists`. **Do not** play with Playground/IDEs, push your brains!..

```
list_1 = ['one', 'four', 'nine']
list_2 = ['@', '*-', 'False']
list_3 = [True, False]
list_4 = [[3], [44], [-12]]
list_5 = [[1, 3], [44, -40], [-12, 1]]
```

Basic Operations with `lists`

- Now! You can Play with Playgrounds. 😀

```
list_1 = ['one', 'four', 'nine']
list_2 = ['@', '*-', 'False']
list_3 = [True, False]
list_4 = [[3], [44], [-12]]
list_5 = [[1, 3], [44, -40], [-12, 1]]
```

`ord()`

gives the ASCII codes for any char

Basic Operations with `lists`

- We can also measure the length of the list by using `len()` function. Take a look at this pre-class example 👇

```
1  city = ['Addis Ababa', 'Istanbul', 'New York', 'Seoul', 'Stockholm', 'Sydney']
2  print(len(city))
3
```

Basic Operations with `lists`

- We can also measure the length of the list by using `len()` function. Take a look at this pre-class example 👇

```
1  city = ['Addis Ababa', 'Istanbul', 'New York', 'Seoul', 'Stockholm', 'Sydney']
2  print(len(city))
3
```

```
1  6
2
```

Basic Operations with `lists`

- Calculate the **length** of these `lists`. **Do not** play with Playground/IDEs, push your brains!..

```
list_1 = ['one', 'four', 'nine']
list_2 = ['@', '*-', 'False']
list_3 = [True, False]
list_4 = [[3], [44], [-12]]
list_5 = [[1, 3], [44, -40], [-12, 1]]
```

Basic Operations with `lists`

- Now! You can Play with Playgrounds. 😀

```
list_1 = ['one', 'four', 'nine']
list_2 = ['@', '*-', 'False']
list_3 = [True, False]
list_4 = [[3], [44], [-12]]
list_5 = [[1, 3], [44, -40], [-12, 1]]
```

Accessing Lists

CLARUSWAY©
WAY TO REINVENT YOURSELF

Table of Contents

```
fruit[1]
```

```
fruit = ['Apple', 'Orange', 'Banana']
```

Indexing a `list`

```
list()
```

CLARUSWAY©
WAY TO REINVENT YOURSELF

Did you find this lesson (from pre-class) interesting or challenging?

Too hard

Just right

Too easy

Pear Deck

Students, drag the icon!

Indexing a `list`

- The formula syntax 👇

```
list_name[index no]
```

Indexing a `list`

- To access or use the elements of a **`list`**, we can use index numbers of the **`list`** enclosed by square brackets.

```
list_name[index no]
```

```
word = ['h', 'a', 'p', 'p', 'y']
print(word[1])
```

Indexing a `list`

- To access or use the elements of a `list`, we can use index numbers of the `list` enclosed by square brackets.

```
list_name[index no]
```

```
word = ['h', 'a', 'p', 'p', 'y']
print(word[1])
```

```
a
```

Indexing a `list`(review the pre-class)

- Here is the pre-class example of indexing a `list` :

```
1  colors = ['red', 'purple', 'blue', 'yellow', 'green']
2  print(colors[2])  # If we start at zero,
3  # the second element will be 'blue'.
4
```

Indexing a `list` (review the pre-class)

- Here is an example of indexing a `list` :

```
1  colors = ['red', 'purple', 'blue', 'yellow', 'green']
2  print(colors[2])  # If we start at zero,
3  # the second element will be 'blue'.
4
```

```
1  blue
2
```

Indexing a `list` (review the pre-class)

- Here is another pre-class example of indexing a nested `list`.

```
1  city = ['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']
2
3  city_list = []
4  city_list.append(city) # we have created a nested list
5
6  print(city_list)
7
```

Indexing a `list` (review the pre-class)

- Here is another pre-class example of indexing a nested `list`.

```
city = ['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']

city_list = []
city_list.append(city) # we have created a nested list

print(city_list)

```

```
[['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']]

```

How many items do the `city` list have?

Students, write your response!

Pear Deck Interactive Slide
Do not remove this bar

Indexing a `list` (review the pre-class)

- Here is another example of indexing a nested `list`.

```
city = ['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']

city_list = []
city_list.append(city) # we have created a nested list

print(city_list)

```

⚠ `city_list` has only one item.

```
[['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']]

```

Tips :

- If you notice that `city_list` has double square brackets.

Indexing a `list`

- Let's access `city_list`'s first and the only element.

```
1  city_list = [['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']]
2  print(city_list[0]) # access to first and only element
3
```

Indexing a `list`

- Let's access `city_list`'s first and the only element.

```
1  city_list = [['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']]
2  print(city_list[0]) # access to first and only element
3
```

```
1  ['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']
2
```

Indexing a `list`

- Let's access `city_list`'s first and the only element.

```
city_list = [['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']]
print(city_list[0]) # access to first and only element

```

```
['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']

```

- The output of the syntax `city_list[0]` is a `list` type. So we can still access its elements.

```
city_list = [['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']]
print(city_list[0][2])

```

⚠ it is also a `list`

What is the output? Try to figure out in your mind...

Students choose an option

Indexing a `list`

- Let's access `city_list`'s first and the only element.

```
city_list = [['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']]
print(city_list[0]) # access to first and only element

```

```
['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']

```

- The output of the syntax `city_list[0]` is a `list` type. So we can still access its elements.

```
city_list = [['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']]
print(city_list[0][2])

```

```
Istanbul

```

Indexing a `list`

- The output of the syntax `city_list[0][2]` is a `str` type. So we can still access its elements.

```
1  city_list = [['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']]
2  print(city_list[0][2][3])
3
```

⚠ it is a `str`

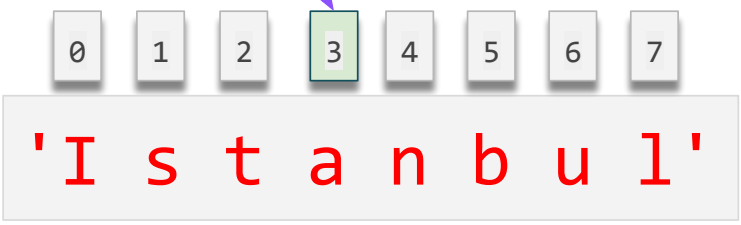
What is the output? Try to figure out in your mind...

Indexing a `list`

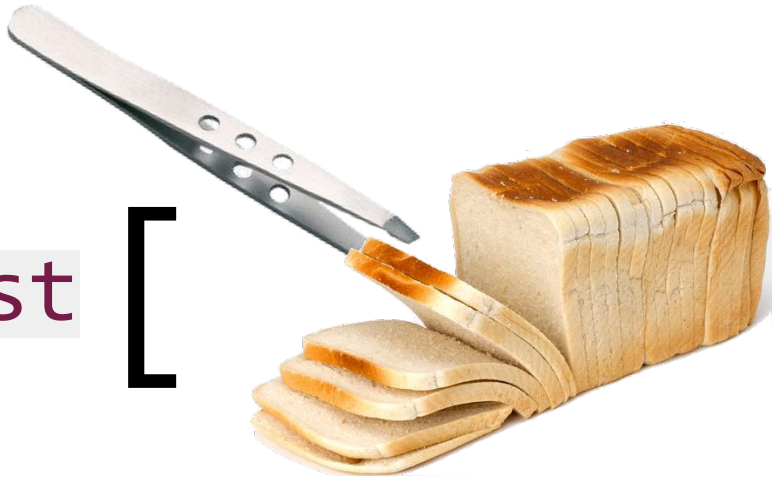
- The output of the syntax `city_list[0][2]` is a `str` type. So we can still access its elements.

```
1  city_list = [['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']]
2  print(city_list[0][2][3])
3
```

```
1  a
2
```



Slicing a `list`



CLARUSWAY©
WAY TO REINVENT YOURSELF

What do you understand from slicing a `list`?

Type your understanding from pre-class content.

EXCAVATE AND EXPAND

Students, write your response!

Slicing a `list`

- The formula syntax 👇

```
list_name = [start:stop:step]
```

From '`start`' to '`stop-1`', by '`step`'.

Slicing a `list`

- Consider this simple example :

```
1  even_numbers = [2, 4, 6, 8, 10, 12, 14]
2  print(even_numbers[2:5])
3
4
```

What is the output? Try to figure out in your mind...

Slicing a `list`

- Consider this simple example :

```
1  even_numbers = [2, 4, 6, 8, 10, 12, 14]
2  print(even_numbers[2:5])
3
4
```

⚠ The type of the output is also a `list`.

Output

```
[6, 8, 10]
```

Slicing a `list`

- Consider this simple example :

```
1  even_numbers = [2, 4, 6, 8, 10, 12, 14]
2  print(even_numbers[2:5])
3
4
```

Tips :

- Slicing is just similar to indexing. The difference is adding **colon** or **colons** in square brackets.

```
[6, 8, 10]
```

CLARUSWAY©
WAY TO REINVENT YOURSELF

Slicing a `list`

- Task :
  - Create a `list` of numbers from **1** to **10** using `range()` function and select **odd** ones by **slicing** method and then print the result.

Slicing a `list`

- Task :
  - Create a `list` of numbers from **1** to **10** using `range()` function and select **odd** ones by **slicing** method and then print the result.

Review the function

- `range(start,stop,step)` function returns an object that produces a sequence of integers from `start` (including) to `stop` (excluding) by `step`.

Slicing a `list`

- The code can be like :

```
1  odd_numbers = list(range(11))
2
3  print(odd_numbers)
4  print(odd_numbers[1:11:2])
5
6
7
```

Output

```
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
[1, 3, 5, 7, 9]
```

Slicing a `list`

- Usage options of slicing are as follows :

- `my_list[:]`: returns the full copy of the sequence
- `my_list[start:]` : returns elements from `start` to the end element
- `my_list[:stop]` : returns element from the 1st element to `stop-1`
- `my_list[::step]` : returns each element with a given `step`

Slicing a `list` (review the pre-class)

- Consider this pre-class example :

```
animals = ['elephant', 'bear', 'fox', 'wolf', 'rabbit', 'deer', 'giraffe']

print(animals[:])  # all elements of the list

```

Slicing a `list` (review the pre-class)

- Consider this simple example :

```
animals = ['elephant', 'bear', 'fox', 'wolf', 'rabbit', 'deer', 'giraffe']

print(animals[:])  # all elements of the list

```

```
['elephant', 'bear', 'fox', 'wolf', 'rabbit', 'deer', 'giraffe']

```

`print(animals) = print(animals[:])`

These syntaxes give the same output.

Slicing a `list` (review the pre-class)

- Slicing options :

```
1  animals = ['elephant', 'bear', 'fox', 'wolf', 'rabbit', 'deer', 'giraffe']
2  print(animals[3:])
3
```

Slicing a `list` (review the pre-class)

- The following example slices the `animals` starts at index=3 to the end.

```
1  animals = ['elephant', 'bear', 'fox', 'wolf', 'rabbit', 'deer', 'giraffe']
2  print(animals[3:])
3
```

```
1  ['wolf', 'rabbit', 'deer', 'giraffe']
2
```

Slicing a `list` (review the pre-class)

- Slicing options :

```
1  animals = ['elephant', 'bear', 'fox', 'wolf', 'rabbit', 'deer', 'giraffe']
2  print(animals[:5])
3
```

Slicing a `list` (review the pre-class)

- The following example slices the `animals` starts at index=0 to the index=4.

```
1  animals = ['elephant', 'bear', 'fox', 'wolf', 'rabbit', 'deer', 'giraffe']
2  print(animals[:5])
3
```

```
1  ['elephant', 'bear', 'fox', 'wolf', 'rabbit']
2
```

Slicing a `list` (review the pre-class)

- Slicing options :

```
1  animals = ['elephant', 'bear', 'fox', 'wolf', 'rabbit', 'deer', 'giraffe']
2  print(animals[::2])
3
```

Slicing a `list` (review the pre-class)

- This example slices animals starts at index=0 to the end with 2 step.

```
1  animals = ['elephant', 'bear', 'fox', 'wolf', 'rabbit', 'deer', 'giraffe']
2  print(animals[::2])
3
```

```
1  ['elephant', 'fox', 'rabbit', 'giraffe']
2
```

Slicing a `list`

- Task :
  - Select and print the **string typed numbers** from the following `list` using *indexing* and *slicing* methods.
  - Your code must consist of a **single line**.

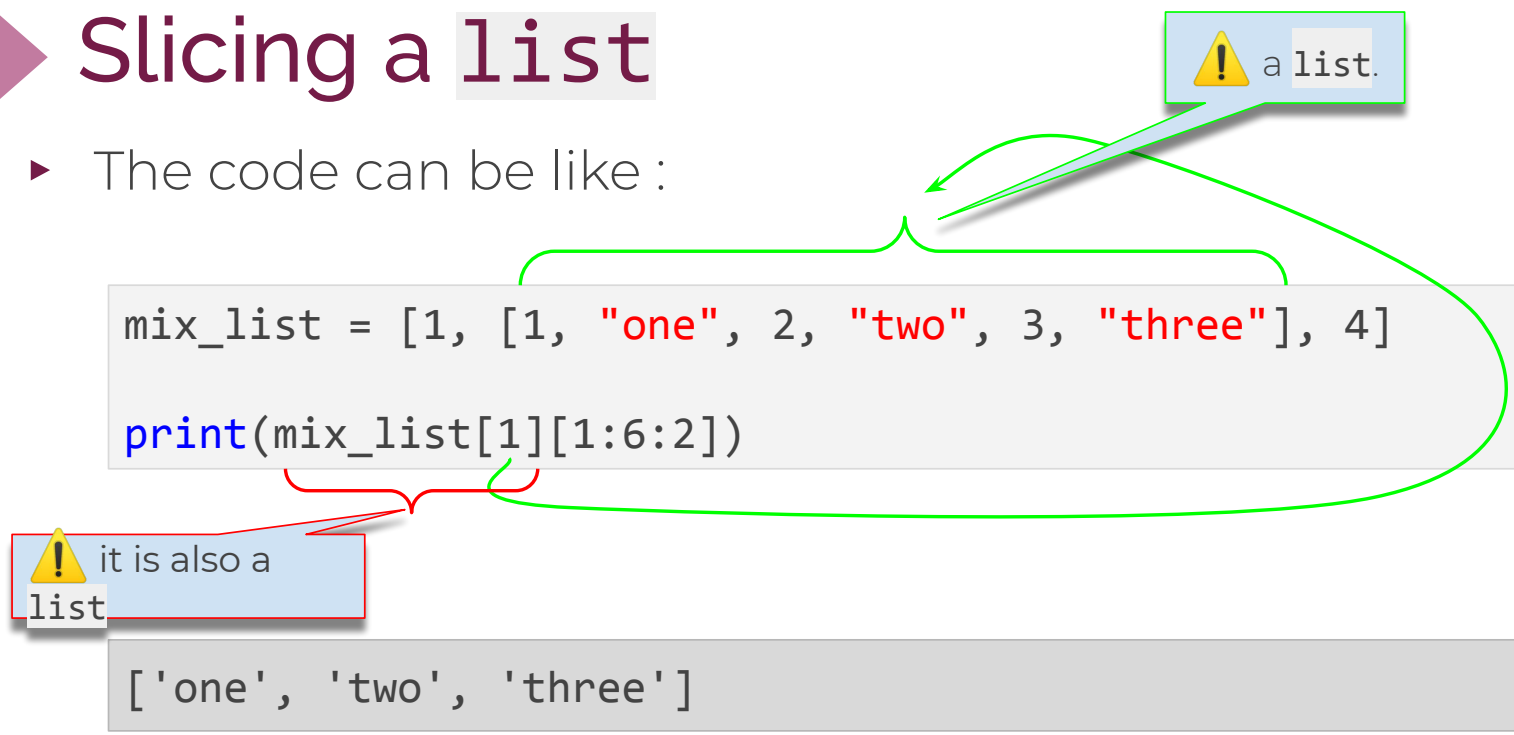
```
mix_list = [1, [1, "one", 2, "two", 3, "three"], 4]
```

Students, write your response!

Pear Deck Interactive Slide
Do not remove this bar

Slicing a `list`

- The code can be like :



```
mix_list = [1, [1, "one", 2, "two", 3, "three"], 4]

print(mix_list[1][1:6:2])
```

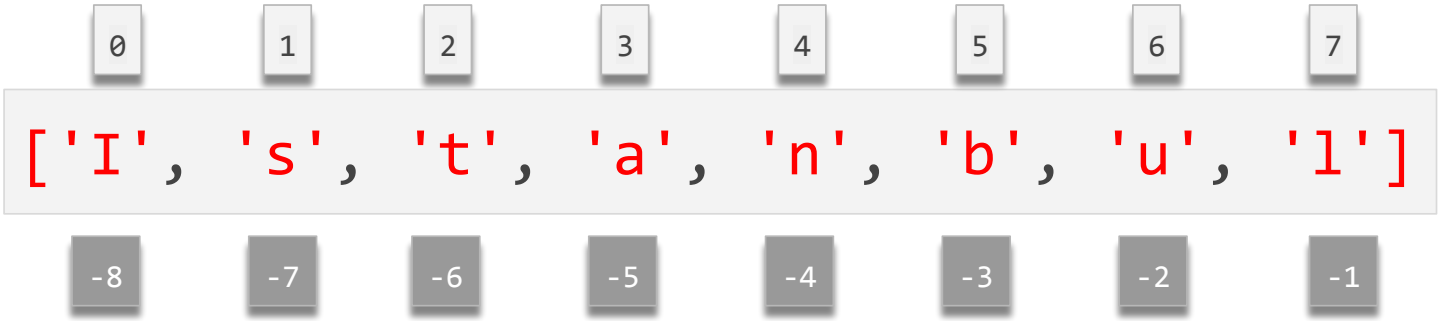
```
['one', 'two', 'three']
```

Negative Indexing & Slicing

CLARUSWAY©
WAY TO REINVENT YOURSELF

Negative Indexing & Slicing

- Sample of the negative indices sequence



CLARUSWAY©
WAY TO REINVENT YOURSELF

Negative Indexing & Slicing(review)

- Take a look at this pre-class example of negative indexing.

```
1  city = ['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']
2  print(city[-4])
3
```

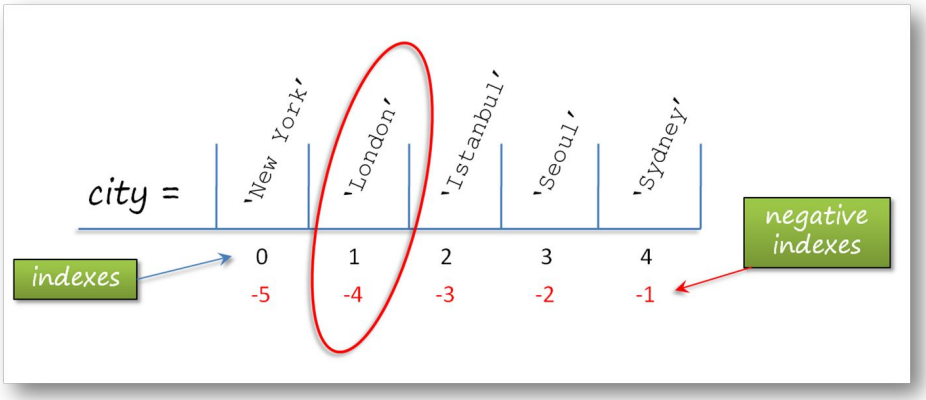
What is the output? Try to figure out in your mind...

Negative Indexing & Slicing(review)

- The output is.

```
1  city = ['New York', 'London', 'Istanbul', 'Seoul', 'Sydney']
2  print(city[-4])
3
```

```
1  London
2
```



Negative Indexing & Slicing(review)

- Now, let's consider this pre-class example of negative slicing.

```
reef = ['swordfish', 'shark', 'whale', 'jellyfish', 'lobster', 'squid', 'octopus']
print(reef[-3:])

```

What is the output? Try to figure out in your mind...

Negative Indexing & Slicing(review)

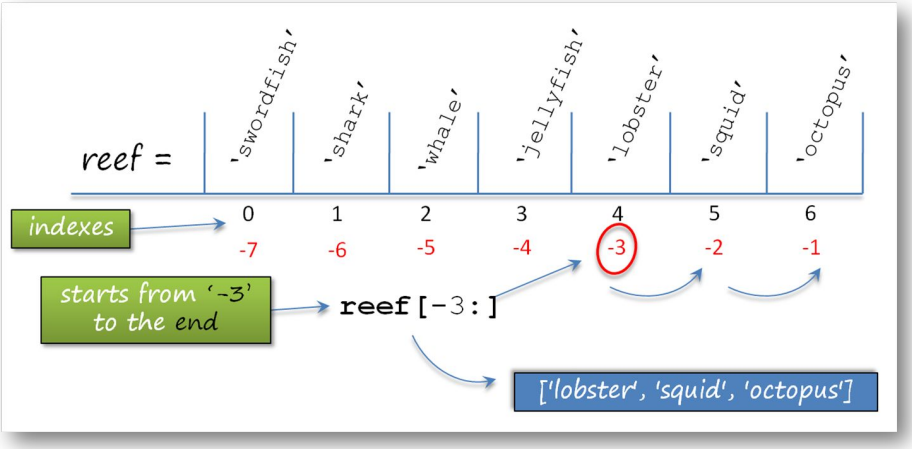
- The output is :

```
reef = ['swordfish', 'shark', 'whale', 'jellyfish', 'lobster', 'squid', 'octopus']
print(reef[-3:])

```

```
['lobster', 'squid', 'octopus']

```



Negative Indexing & Slicing(review)

- Here's another pre-class example of negative slicing.

```
1  reef = ['swordfish', 'shark', 'whale', 'jellyfish', 'lobster', 'squid', 'octopus']
2  print(reef[:-3])
3
```

What is the output? Try to figure out in your mind...

Students, write your response!

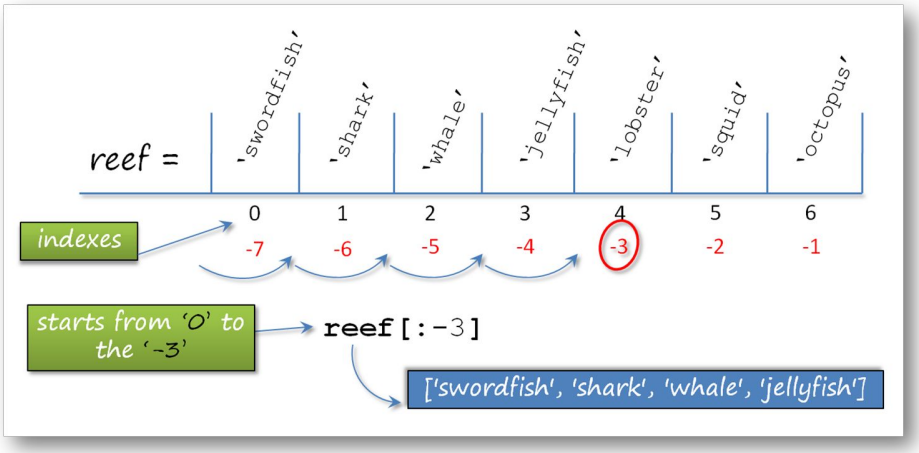
Pear Deck Interactive Slide
Do not remove this bar

Negative Indexing & Slicing(review)

- The output is :

```
1  reef = ['swordfish', 'shark', 'whale', 'jellyfish', 'lobster', 'squid', 'octopus']
2  print(reef[:-3])
3
```

```
1  ['swordfish', 'shark', 'whale', 'jellyfish']
2
```



Negative Indexing & Slicing(review)

- Let's see negative **step**ping in the pre-class content :

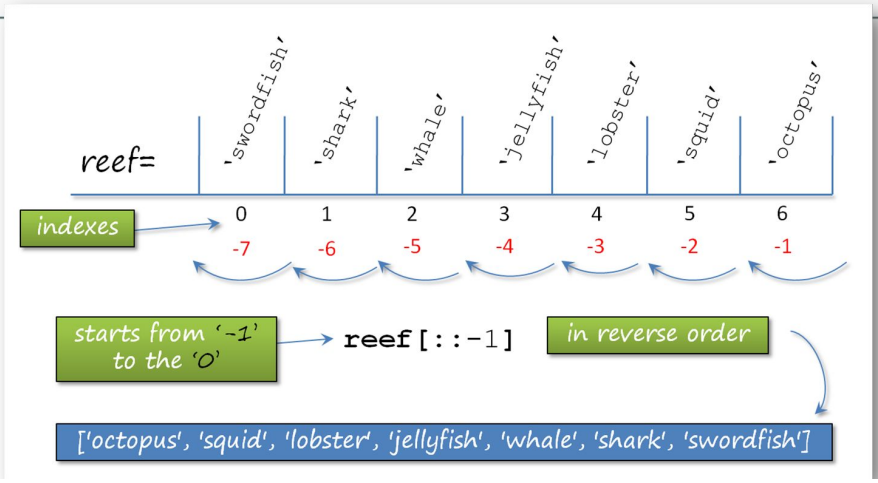
```
1  reef = ['swordfish', 'shark', 'whale', 'jellyfish', 'lobster', 'squid', 'octopus']
2  print(reef[::-1])  # we have produced the reverse of the list
3
```

Negative Indexing & Slicing(review)

- The output is :

```
1  reef = ['swordfish', 'shark', 'whale', 'jellyfish', 'lobster', 'squid', 'octopus']
2  print(reef[::-1])  # we have produced the reverse of the list
3
```

```
1  ['octopus', 'squid', 'lobster', 'jellyfish', 'whale', 'shark', 'swordfish']
2
```



Negative Indexing & Slicing(review)

- Here's another example of negative `step`ping.

```
1  reef = ['swordfish', 'shark', 'whale', 'jellyfish', 'lobster', 'squid', 'octopus']
2  print(reef[::-2])
3
```

What is the output? Try to figure out in your mind...

Students, write your response!

Negative Indexing & Slicing(review)

- Here's another example of negative `step`ping.

```
1  reef = ['swordfish', 'shark', 'whale', 'jellyfish', 'lobster', 'squid', 'octopus']
2  print(reef[::-2])
3
```

```
1  ['octopus', 'lobster', 'whale', 'swordfish']
2
```

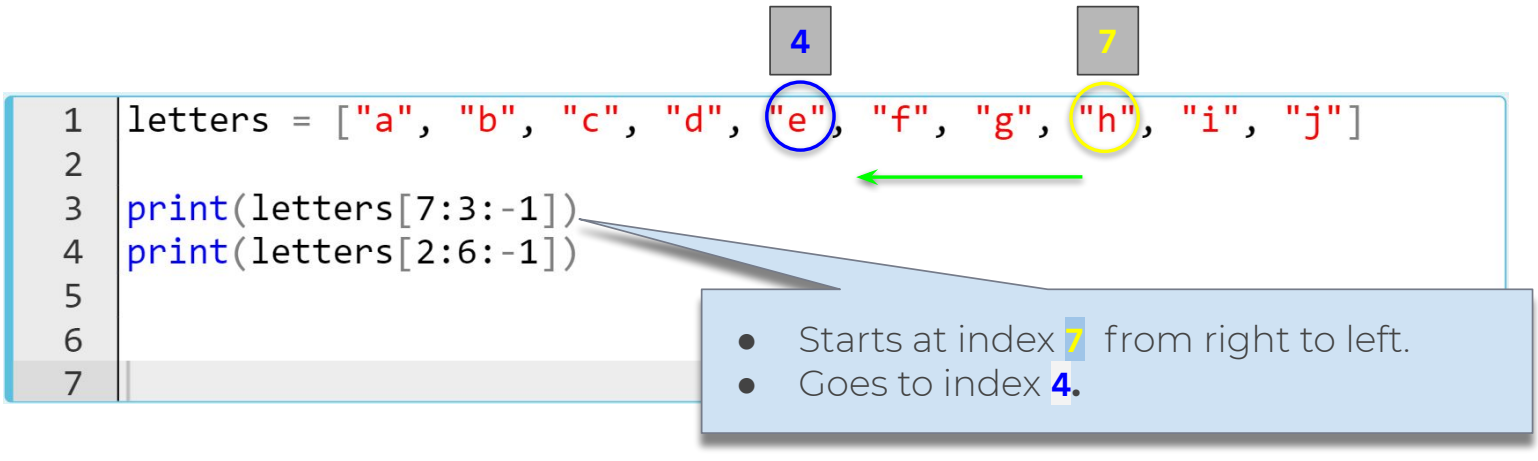
Negative Indexing & Slicing

Tips :

- If you choose negative step with the start and end indexes together, those should be used accordingly, that is, the `end` index should be less than the `start` index.

```
1  letters = ["a", "b", "c", "d", "e", "f", "g", "h", "i", "j"]
2
3  print(letters[7:3:-1])
4  print(letters[2:6:-1])
5
6
7
```

Negative Indexing & Slicing



```
['h', 'g', 'f', 'e']
[]
```
